REPO RADAR

8 trending GitHub repos: links and the exact commands I ran

Every repo below was tested on **November 5 to 6, 2026**, inside a locked sandbox: a fresh temporary folder, an emptied environment (no tokens, no keys), a time limit on every command. Only commands documented by each README were run. Stars are from the GitHub API snapshot of November 5, 2026.

The scorecard

1. **obra/superpowers** (MIT, 312,566 stars). Contents verified: 15 skills. The official install is a Claude Code plugin command, which could not be run in the sandbox.
2. **mattpocock/skills** (MIT, 313,670 stars). `npm install` took 4.7 s, clean. 39 skill files counted.
3. **heydamir/unslop** (CC-BY-4.0, 8,883 stars). The skill folder was copied clean. Snapshots and story videos need Playwright and ffmpeg: not tested.
4. **caru-ini/stack-diagram** (MIT, 1,782 stars). Installed in 6.7 s. Diagram generation not tested.
5. **wheresryan22/anatomy** (MIT, 24,979 stars). Installed in 6.6 s. Figure generation not tested.
6. **patch-gg/pixelfx** (MIT, 4,857 stars). Fully verified: install 3.4 s, then 90 frames rendered in 1.9 s.
7. **Graphify-Labs/graphify** (Apache-2.0, 142,553 stars). Fully verified: 24,763 nodes and 52,768 edges built from 1,159 files in 83 s.
8. **deepseek-ai/DeepInfer** (Apache-2.0, 25,410 stars). Broke in the sandbox: wrong Python version (3.11 instead of 3.12), install did not finish in 240 s.

The commands, repo by repo

pixelfx (Node 18+)

```
git clone https://github.com/patch-gg/pixelfx.git
cd pixelfx
npm install
node tools/render.mjs fire/campfire --sheet
```

Writes a contact sheet, a sprite sheet and a JSON file for the campfire effect.

graphify (Python 3.10+)

```
python3 -m venv v
v/bin/pip install .
v/bin/graphify update .
```

Builds `graphify-out/graph.json`, `graph.html` and `GRAPH_REPORT.md` from code, locally, with no AI. The README's own recommended install is `uv tool install graphifyy`.

mattpocock/skills

```
git clone https://github.com/mattpocock/skills.git
cd skills
npm install
find skills -name SKILL.md | wc -l
```

stack-diagram and anatomy (skills CLI)

```
npx skills add caru-ini/stack-diagram -a claude-code
npx skills add wheresryan22/anatomy -g -a claude-code
```

unslop

Copy the folder `skills/unslop` into your agent's skills directory. For snapshots and story videos, install Playwright and ffmpeg first, as its README says.

DeepInfer

Do not expect this one to run on a laptop. Its README asks for Linux, GCC 13 or newer, Python 3.12, CUDA 13, and lists only NVIDIA SM100 GPUs or Huawei Ascend 950 NPUs as supported hardware.

3 things to do

1. Run a repo's own documented command for 60 seconds before you read about it for an hour.
2. Check the license before you build on it. unslop is CC-BY-4.0, a content license, not MIT.
3. Check the Python and Node versions in the README first. It would have saved me one failure.

2 mistakes to avoid

1. Treating stars as proof that something runs.
2. Treating "installed" as "works": a skill you can install is not a skill you have tried.

Glossary

- **Skill:** a folder with a text file of instructions that an AI coding assistant loads when the task fits.
- **Sandbox:** a throwaway folder and an emptied environment, so a repo you test cannot see your keys.
- **Sprite sheet:** one image holding every frame of an animation, used by game engines.
- **Knowledge graph:** nodes (functions, files) and edges (calls, imports) you can query.

Stars and facts are as of November 5 to 6, 2026. Repos change fast. This is not investment, legal or security advice.
