AI EXPLAINED SIMPLY

Explain Any AI Idea With an Analogy: Prompt Pack

Companion to the Short "AI Explained With Mushrooms". Copy, paste, replace the [brackets].

The idea in the video

- A model learns from labeled examples: it guesses, gets corrected, and adjusts a little. This loop is called training.
- It finds patterns (colors, shapes) by itself; nobody writes the rules by hand.
- Limit: shown something unlike its examples, a model can still answer with a confident tone. Treat its output as a strong guess, not proof.

Prompt 1: the analogy

"Explain [concept] to a curious 12-year-old using one everyday analogy. Keep it under 100 words. Then list where the analogy breaks down."

Prompt 2: the honest limit

"For [concept], give me one real limitation that a beginner should know, in one sentence, with no hype."

Prompt 3: the 45-second script

"Write a 45-second spoken script that explains [concept] with the analogy of [object]. Short sentences. Open with the result, end with one honest limit."

Prompt 4: check the answer

"List the claims in your last answer that I should verify, and name the type of source that would confirm each one."
